A Temporal roles in NHANES

Adults ≥40 years

X: 16 baseline variables
Survey / examination

Measured Z
RDW / hemoglobin

MAXM → HMX instrument change

2003–2004
Fit
n=2,955; events=370

2005–2006
Select
n=2,804; events=288

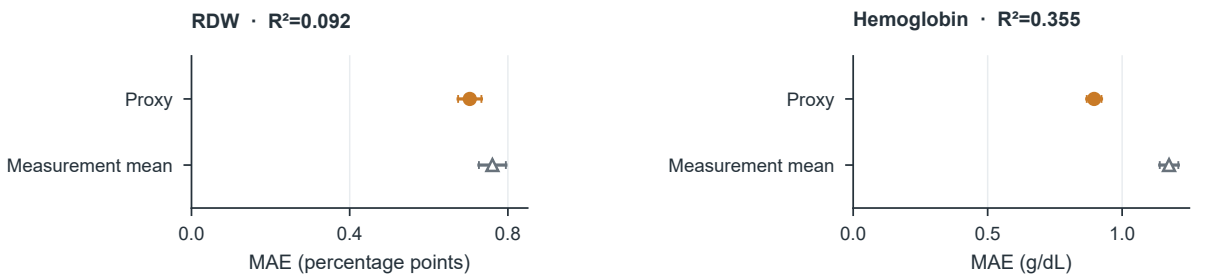

2007–2010
Evaluate
n=7,477; events=648

2003–2006 Refit / final development
n=5,759; events=658
Pooled first two periods

Fitted models

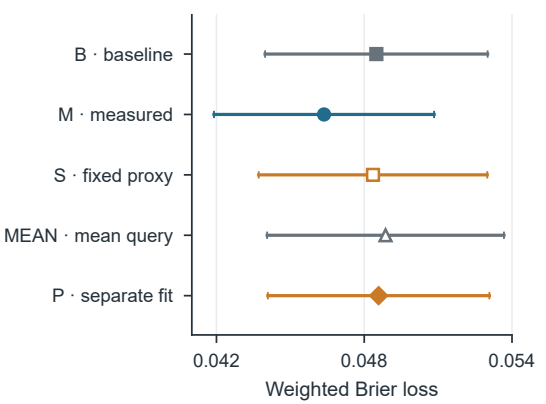

Later-cycle evaluation
Same cases for all five routes

B Measurement prediction

C Five-route Brier losses

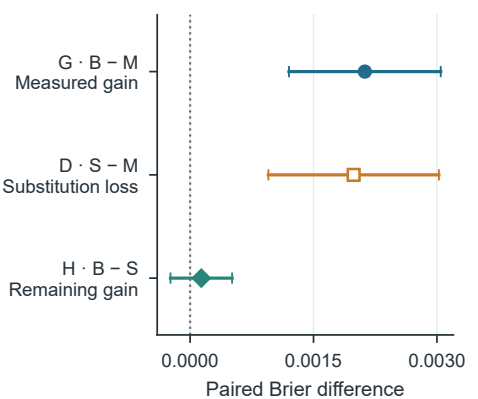

M / S / MEAN: one fitted M

B / P separately fitted; P uses OOF training proxies.
B–D: 95% survey-design t intervals; fixed fits.

D Paired Brier contrasts

G / D / H use paired losses

R = H/G: 6.4%
95% Fieller: −11.3% to 29.4%

Primary ≥40 years: positive remaining gain not established. Age 40–79 sensitivity: Table S30.
